

Cracking Passwords with Python

Objective:

Simulate password cracking techniques using Python to understand brute force and dictionary attacks. You will implement these attacks to break hashed passwords stored in a database.

Setup: Create a simple database with usernames and hashed passwords.

Use Python to simulate password cracking using brute force and dictionary attacks using the file 10k-most-common.txt file.

Tasks: Write a Python function to brute force a password by trying every possible combination of characters.

Write a Python function to perform a dictionary attack using a list of common passwords.

Crack the password for a specific user by using both methods.
